

ABSTRACT OF THE DISCLOSURE

A damper assembly for a glove box includes a fixing member attached to the rear part of a glove box, the fixing member having a fitting protrusion, and a damper having a fitting piece, through which the fitting protrusion is inserted, whereby the number of the parts of the damper assembly is reduced. The fixing member of the damper assembly is made of a plastic material, whereby instability of the glove box is prevented when the glove box is opened or closed.
